1 (bases 1 to 15239)
Whitehead, S.S., Hanley, K.A., Blaney, J.E. Jr., Gilmore, L.E.,
Elkins, W.R. and Murphy, B.R.
Substitution of the structural genes of dengue virus type 4 with
those of type 2 results in chimeric vaccine candidates which are
attenuated for mosquitoes, mice, and rhesus monkeys

I (bases I to 15270)
Whitehead, S.S., Hanley, K.A., Blaney, J.E. Jr., Gilmore, L.E.,
Elkins, W.R. and Murphy, B.R.
Substitution of the structural genes of dengue virus type 4 with
those of type 2 results in chimeric vaccine candidates which are
attenuated for mosquitoes, mice, and rhesus monkeys
Vaccine 21 (27-28), 4307-4316 (2003)

New transposon nucleic acid comprising a genetically engineered translation stop signal within a transposon end sequence recognized by a transposase useful for producing deletion derivatives of polypeptide. Transposon; genetic engineering; transposase; Cat-Mu; Tn7-Kan; ds. Modified Tn7-Kan(Stop)-transposon. ACF58174 standard; DNA; 4814 BP. 14-APR-2003; 2003WO-F1000285. 18-APR-2002; 2002FI-00000746. (first entry) Savilahti H, Tieaho V; (FINN-) FINNZYMES OY WPI; 2003-845329/78. WO2003087370-A1. 15-JAN-2004 23-OCT-2003. Synthetic. ACF58174; RESULT 1 ACF58174

The invention relates to a transposon nucleic acid comprising a genetically engineered translation stop signal in the three reading frames at least partly within a transposon end sequence recognized by a transposase. The transposon is useful for producing deletion derivatives of polypeptide coding nucleic acids. The method involves performing a transposition reaction in the presence of a target nucleic acid containing a polypeptide coding nucleic acid and in the presence of a transposon containing a genetically engineered translation stop signal Claim 7; Page 31-32; Opp; English.

                                                                                                                     New tetravalent vaccine containing a common nucleotide deletion in the 3' untranslated region of dengue types 1, 2, 3, and 4, useful for preventing of disease in humans caused by dengue virus, or for inducing immune
                                                                                                                                                                                                                                                                tetravalent and containing a common nucleotide deletion in the 3' untravalent and containing a common nucleotide deletion in the 3' untranslated region of dengue types 1, 2, 3, and 4. The invention may be useful for the development of compounds with a virucide or immunostimulant activity or as a vaccine. The tetravalent vaccine is useful in the prevention of disease in humans caused by dengue virus. Unlike previous tetravalent vaccine, the new tetravalent vaccine is unique since they contain a common shared attenuating mutation which eliminates the possibility of generating a virulent wild type virus in a subject to be vaccinated since each component of the vaccine possesses the same deletal attenuating deletion mutation. The vaccine also is able to induce humoral and cellular responses against al of the (non-)structural proteins present in each dengue virus serotype. The present sequence is that of the DEN3 cDNA plasmid p3 which is related to the

This invention relates to a novel immunogenic composition being tetravalent and containing a common nucleotide deletion in the 3' untranslated region of dengue types 1, 2, 3, and 4. The invention may be untranslated region of dengue types 1, 2, 3, and 4. The invention may be immunostimulant activity or as a vaccine. The tetravalent vaccine is useful in the prevention of disease in humans caused by dengue virus. Unlike previous tetravalent vaccine, the new tetravalent vaccine is unique since they contain a common shared attenuating mutation which eliminates the possibility of generating a virulent wild type virus in a subject to be vaccinated since each component of the vaccine possesses to induce humoral and cellular responses against a lof the (non-structural proteins present in each dengue virus serotype. The present sequence is that of the DENZ CDNA plasmid P2 which is related to the

This invention relates to a novel bacterial host cell comprising at least two copies of an amplification unit in its genome, where two or more amplified chromsomal copies of the gene of interest are produced. The amplification unit comprises at least one copy of a gene of interest and amplification unit comprises at least one copy of a gene of interest and expressible conditionally essential gene, where the conditionally comprises or transcribed from a heterologous promoter having an activity substantially lower than the endogenous promoter of the conditionally essential gene, and where the conditionally compressed in the conditionally essential gene, and where the conditionally compressed in the conditional would render the cell auxotrophic for at least one specific substance or unable to utilize one or more specific sole carbon source. The bacterial host cell is useful for producing of a protein having several copies of a gene of interest stably chromosomally integrated, without leaving antibiotic resistance marker genes in the strains. The present sequence is that of a plasmid DNA sequence which was used in the exemplification of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          5780

The present sequence represents a Tn7 donor plasmid pEM delta. Transposon Tn7 encodes an ATP-utilising regulatory protein that contains a mutation that allows efficient and simple insertion of, and reduced target site specificity of, a transposable element derived from the transposon. The ATP-regulatory protein and compositions are used for the efficient, nonspecific and simple insertion of a transposon or transposable element into a DNA segment. This is useful in DNA sequencing, for genetic analysis by insertional mutagenesis, or for alteration of gene expression

encoding mutant ATP using proteins for insertion - which irandom, with reduced site specificity; for DNA sequencing

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to a mutant ThSC transposition regulatory protein. This mutant protein activates a transposase in the absence of ThSD or ThSE, which directs intermolecular transposition of a transposable element and discriminates between immune and nonimmune targets, in a manner which is characterised by reduced target site selectivity. It may be used in DNA sequencing methods, for genetic analysis by insertional mutagenesis and alteration of gene expression by insertion of a given genetic sequence. The present DNA sequence is transposon donor plasmid pEM delta, a pBR plasmid containing a kanamycin mTh7 element. This sequence is used in the exemplification of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Mutant TnsC transposition regulatory protein for use in DNA sequencing, for genetic analysis, and alteration of gene expression by insertion of given genetic sequence, comprises an alanine to valine substitution.

THE invention relates to a mutance given genetic sequence, comprised between the modern activates a comparised between the modern activates and discriminates between the managenesis and alteration of genetic sequence. The present in DMA sequencing method mutagenesis and alteration of genetic sequence. The present in DMA sequencing method mutagenesis and alteration of genetic sequence. The present in DMA sequencing method contained the semplianed contained cont
                                                                                                                                                                                                                                         3962

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      3932
kanamycin gene with SalI sites at the junctions. The backbone is pTRC99 (Pharmacia). Transposon Tn7 encodes an ATP-utilising regulatory protein that contains a mutation that allows efficient and simple insertion of, and reduced target site specificity of, a transposable element derived from the transposon. The ATP-regulatory protein and compositions are used for the efficient, non-specific and simple insertion of a transposon or transposable element into a DNA segment. This is useful in DNA sequencing, for genetic analysis by insertional mutagenesis, or for alteration of gene expression by insertion of a desired sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    3933 TTCAACAGGCCAGCCATTACGCTCGTCATCAAAATCACTCGCATCAACCCAAACCGTTATT 3992

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 3573 TICAACAAAGCCGCCGTCCCGTCAAGTCAGCGTAATGCTCTGCCAGTGTTACAACCAATT 3632
                                                                                                                                                                                                                                                    The invention relates to a mutant ThsC transposition regulatory protein. This mutant protein activates a transposase in the absence of ThsD or ThsE, which directs intermolecular transposition of a transposable element and discriminates between immune and nonimmune targets, in a manner which is characterised by reduced target site selectivity. It may be used in DNA sequencing methods, for genetic analysis by insertional mutagenesis and alteration of gene expression by insertion of a given penetic sequence. The present DNA sequence is transposon donor plasmid pEM delta R.adj to 1, used in the exemplification of the invention. This plasmid comprises a 1625 bp mini-Th7 element:199 bp of Th7R and 166 bp of Th7L flanking a Kan gene with Sall at the junctions
                                                                                                                                                                                                  æ
                                                                                                                                                                                     for use in DNA sequencing, expression by insertion of to valine substitution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      TGAGAGCTTTGTTGTAGGTGGACCAGTTGGTGATTTTGAACTTTTGCTTTGCCACGGAAC

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention relates to a transposon encoding an ATP-utilising regulatory protein containing a mutation that allows efficient and simple insertion of and reduced target site specificity on the transposon. The invention is used in DNA sequencing methods, for genetic analysis by insertional mutagenesis, and alteration of gene expression. The invention is used to achieve efficient, simple, non-specific or random insertion into any given DNA segment. The present sequence is donor plasmid pEM delta R.adj to 1 DNA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     mutation
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                4380 TTTTGTCACTCTTCCCTAAATAATCCTTAAAAACTCCATTTCCACCCCTCCCAGTTCCCA

The present invention describes a process for the recombinant production of desired heterologous polypeptides (HP). The method comprises culturing a bacterial cell expressing a fusion protein (FP), comprising a colypeptide with autoproteolytic activity of autoprocease Npro and a HP, isolated and treated so that HP is cleaved autoprocease Npro and isolated and treated so that HP is cleaved autoproceolytically by Npro activity from FP. The method is useful for producing a heterologous polypeptide with a clearly defined homogeneous N-terminus in a bacterial, preferably Escherichia coli cell. HP includes enzymes, agents with pharmaceutical activity such as inerleukins, interferons such as leukocyte interferons, growth factors, in particular haemopoietic or wound-healing growth factors, such as granulocyte colony stimulating factor (GCSF), erythropoietin, hormones such as human growth hormone (HGH), antibodies or vaccines The present sequence represents the Nproferon autoprocease and hGH is human growth hormone, which is used in an example
